Abstract (en)

[origin: EP0881347A1] The locking hinge for a sliding door (2) comprises a bolt (3) integral with a sliding assembly. An anti-fault operating device (6) comprises a finger sensor (7) movable in the transverse direction (8) and is permanently assisted by a spring (9) to its departure position. A stop (11) integral with the sensor engages complementary means in the sliding assembly to prevent, in the sensor departure position, sliding of the bolt into its locked position, without opposing this sliding in the reentrant position of the sensor. A movable part (13) slides relative to a casing forming a runner (12) in the transverse direction and is fixed to the sensor and to the stop.
