Abstract (en)
[origin: WO9806467A1] This invention concerns an inline skate consisting of a shoe (10, 11), a removable roller unit (1-5), a mounting unit (12) on the shoe, and a device for locking and unlocking the roller unit (1-5) with the mounting unit (12). To achieve optimal rolling and to permit comfortable walking with the shoe after easy removal of the roller unit, the mounting unit (12), which preferably is of a harder material than the shoe body (10), extends laterally along the shoe body (10) in an upward direction from the shoe sole (11). The roller unit (1-5) is provided with an essentially horizontal base plate (4) and essentially vertical side walls (5) for receiving the mounting unit (12). Thus, essentially vertical entry and exit from the roller unit (1-5) is made possible and includes the device for locking and unlocking the roller unit (1-5) with the mounting unit (12) engages outside the area of the shoe sole (11) into the mounting unit (12).
