Abstract (en)

[origin: GB2310632A] Apparatus for use in a gravure press comprises an impression roller (1) which is at least partly electrically conductive and at least one electrical transfer device (34) adjacent the surface of the roller and connected to a power source, in use, to enable a charge to be applied to the surface of the roller by each such transfer device. The roller cooperates with a gravure roller (2). The transfer device is movable relative to the surface of the roller, during printing, to mitigate the adverse image-patterning effects on gravure printing of any spatial discontinuities in the level of charge transfer from the spaced transfer devices onto the roller.
