Abstract (en)

[origin: FR2756215A1] The invention concerns a device for adjusting a doctor blade (1) in contact with a print roller (3) along its generator, in which the doctor blade produces a rotating motion about the print roller (3) which is centred about a rotation axis (0) of the latter. This device is characterised in that the doctor blade (1) is mounted on a mobile carriage (17) capable of moving in a plane perpendicular to the axis of the print roller (3) for producing a translational motion along a direction (XX') which is substantially parallel to an axis radial to the print roller (3), and which passes through a point of contact(F) of the doctor blade (1) with the latter.
