Abstract (en)  
The present invention provides a valve for a pressurised container. The valve comprises a hollow body (10) mounted onto the container, the hollow body (10) having an internal volume having a feeding means (14), a first body (11) retained in the hollow body (10), the first body (11) being mobile with respect to the hollow body (10) and co-operating with the feeding means (14) so that the first body (11) obstructs the feeding means (10) in a predetermined orientation of the container and the valve comprises a second body (12), the second body (12) being in magnetic interaction with the first body (11), so as to reinforce the action of the first body (11) particularly when used in combination with viscous product or/and high flow rates.
