Abstract (en)

[origin: EP0884532A1] The temperature regulation takes measurements (11,12) of water temperature at the inlet and at the outlet of the area (3) of pipe exposed to the flame (7). The temperature measurements are delivered to a controller (10). The burner has its fuel supply controlled by a valve (5) which can adjust the fuel flow and can cut off the fuel supply to the burner. The valve is controlled by a solenoid (9), which is in turn controlled by the controller that receives the temperature data. The controller can cause the burner to operate with continuous control or in chopped mode, which is invoked at low power levels where flame would be unstable.
