Abstract (en)
A patch applying apparatus 10 for adhering a patch 64 to the periphery around a punched hole formed in a document P comprises a lower main body 11 for pivotally supporting a platen 14 and an upper main body 12 which is hinged to one end of the lower main body 11. A stack of the patches 64 is held at the free end of the upper main body 12 in such a manner that the adhesive layers of the patches face toward the platen 14. When a patch urging force is imparted to the patch while the document P is positioned in a given position on the platen 14, the platen 14 is pivoted to a substantially parallel position with respect to the face of the patch 64 for bringing the patch 64 into a face-to-face contact with the document P. When the urging force is released, the platen 14 is returned to an inclined position for separating the adhered patch 64 from the next patch 64.
