Abstract (en)
[origin: WO9733784A1] The invention relates to a device for detecting the positions of pivotable parts of a point, for example tongue rails (1, 2). Said device has at least one sensor (4, 5, 6, 7) in the form of a continuous distance sensor. The sensor output is connected to a circuit arrangement (10) for two separate evaluations. A first evaluation is in the form of a distance evaluation and a second evaluation is in the form of an operational check of the sensor. The invention also relates to a process for signal evaluation.
