Abstract (en)

[origin: WO9828581A1] The invention concerns a double-walled container such as, for example, a housing or trough with inner and outer walls (1, 5) made of a material which is a good heat conductor. In order to enable the container to be produced more economically and more easily whilst retaining the interruption of the thermal boundary between the interior and exterior, it is characterized in that the cross-sectional area of the inner and/or outer walls (1, 5) is reduced in predetermined regions.
