Abstract (en)
[origin: EP0887294A1] The roll wound (17,19) onto the winding tube (15) is supported by at least two supports (5,11) formed by first (7) and second support rollers. At least one lowering mechanism (27) withdraws the roll and is swivelled on an axis parallel with the longitudinal axis of the first support roller. The second support can occupy at least two functioning positions. The second support is in the form of a load-relieving module (46) comprising at least two support rollers around which at least one continuous support belt runs.
