Abstract (en)
[origin: EP0887487A2] The wall holder is provided with at least one coupling section for connection to at least one grip bar. The individual component parts (1,19,20), of the hand rail, particularly the coupling section (30,31) of the connecting component (20) of the wall holder (19) and the grip bar (37) can be brought into securing engagement for connection to one another. The coupling section may have at least one securing component (24-29) extending axially over the connecting component, particularly in the form of a spring-elastic securing tongue (32) with a radially outwardly extending securing nose formation or securing strip (33). This strip can engage positively in a securing cavity in an end area of the grip bar.
