Abstract (en)

A mobile communication device is disclosed, which, when being in a powered on state, is able to receive calls and, when being in a powered off state, is unable to receive calls. The device comprises a first radio receiver circuit, and a ringing mechanism for activating a ring signal in response to receiving, by means of the first radio receiver circuit, a call to the device, and a second radio receiver circuit, and means for activating the ringing mechanism when a code signal is received by the second radio receiver circuit independent on whether the device is in the powered on state or in the powered off state. <IMAGE>
