Abstract (en)
The thermostat of the invention is based on a classic controllable thermostat in which one of the three classic spacers, specifically the upper spacer, is provided with a slot or socket into which an ancillary strip standing as a temperature probe is laterally plugged. Furthermore, the insulating shaft through which the control knob acts on the moving control has an intermediate ledge through which it acts on the probe strip, and therefore upon driving the control knob, both the main moving strip and the probe strip are acted on. Similarly, contact between the probe strip and the moving strip, to close the signalling circuit, is established through the free end of said probe strip and with the assistance of a screw acting as an electrical contact. <IMAGE>
