Abstract (en)

[origin: WO9734659A1] The fire-extinguishing device proposed includes a container (12), holding a gas under pressure, and a fusible hollow element (48) designed to actuate the device. The fusible hollow element (48) is connected to the extinguishant container (12) in such a way that it is acted on by the compressed gas in the container . A pressure regulator (42) is fitted between the extinguishant container (12) and the fusible hollow element (48). The pressure regulator (42) enables the device to be operated using CO₂ for instance as the extinguishant, even in situations in which the ambient temperature varies widely. The fusible hollow element (48) can also be designed as a feed line for the extinguishant. Also proposed is a valve for a fire-extinguishing device of this kind.
