Abstract (en)
[origin: WO9736070A1] A stop element holder (14) with a stop element for wall formwork for erecting a concrete wall on a concreted base (10) can be secured by securing means to a rising reinforcement connection element (12). The stop element holder (14) has a receiving aperture (34) for the connection element (12) and before being fixed can rotate about the axis (z) of the connection element (12). The stop element takes the form of a bent stop surface (18) with a constantly changing distance (r) to the axis (z) of the connection element (12). The stop element holder can be aligned by a simple rotation on a guide cord and fixed in its final position.
