Abstract (en)
[origin: WO9735286A1] The invention concerns a coin-checking arrangement in which, during checking, the coins (1) move progressively along a side wall (6) of a coin channel (2) and past two coil halves (4a, 4b) which are disposed opposite each other either side of the coin channel (2) and are connected in series in phase opposition. The coil half (4b), which is located on the same side of the coin channel (2) as the side wall (6), has lower resistance than the other coil half (4a) and preferably consists of litz wire.
