Abstract (en)

[origin: EP0888948A1] The coupling arrangement (9) connects the two frame sections (5,6) of separate two-wheel bogies carrying adjacent ends of two separate carriage bodies. It has two pairs of flexurally stiff connecting components (18,19) rigidly connected to one of the frame sections and offset in relation to each other in the transverse direction of the bogie. Each connecting component is coupled to the opposite connecting component on the other frame section via a knuckle joint (21). This joint is flexible at least in the longitudinal direction of the bogie, so that pivoting is possible around a vertical axis (22).
