Abstract (en)
[origin: EP0888974A1] The device (1) for emptying a tube (20) formed by a body (24) with deformable walls comprises a base plate (2). The plate length is slightly less than the height under the tube shoulder. A support plate (8) is pivoted on the base plate around an axis (A), so that when the tube is placed between the base plate and the support plate, turning of the support plate onto the base plate causes crushing of the tube wall between them. The support plate comprises two parts (9,10) pivoted about an axis (B) parallel to the axis (A). This enables selectively supporting all or part of the support plate on the base plate and emptying the whole or part of the tube.
