Abstract (en)
[origin: EP0889181A2] The handle is attached to the outside of a housing (1) which has an internal cavity (2) for the mechanism. The mechanism has a central pivot (4) attached to the handle (3) which can move between two positions. There are two mobile components (11) which move along the cavity between two positions. They are positioned at the ends of the cavity and have devices for attaching them to the opening and closing mechanism. There are two long components (6) placed opposite each other on either side of the transverse axis. These are made of flexible, resistant material such as plastics and linked to one side of the central pivot and to one of the mobile components. The long components have a tooth (7) which fits into a seat (8) on the pivot and a second tooth (9) which fits into a seat (10) in the mobile component.
