Abstract (en)
A printing system comprising at least one printer for printing images on sheets in accordance with electrical image signals to be fed to the printer, control means for feeding electrical image signals to the at least one printer and inputting means for receiving and feeding electrical image signals to the control means. The control means comprise operating means for inputting print orders relating to the electrical image signals to be fed to the at least one printer and display means adapted to display operating information. Means are also provided for generating order processing time signals relating to the estimated processing time for printing print orders by the at least one printer. The display means are also adapted to display a circle segment having an aperture angle whose value is determined by the order processing time signals. In a further embodiment an angular position of the circle segment is adjustable and its value is determined by a time signal corresponding to the actual time. <IMAGE>
