Abstract (en)

[origin: WO9737522A1] A suction pipette (2) of the fitting device can be lowered together with a suction held component (4) onto a printed circuit board (e.g. 5) by means of a drive. The suction pipette (2) has a spring-mounted point (3) whose deflection when it contacts the printed circuit board triggers a switching off signal for the drive and compensates for the run-on displacement of the drive. Components (4) may thus be quickly and reliably set on the printed circuit board (e.g. 5).
