Abstract (en)  
[origin: WO9810937A1] An ink escape portion as a space portion into which ink moves temporarily during a stamping operation is so formed as to continue from an ink absorber, and a stamping sheet is clamped between an inner protrusion of a holder and outer protrusion of a body to which partial overlapping margins are set. While the stamping sheet is brought into pressure contact with the body, the holder is slid and the stamping sheet is pulled outward and fixed. In this way, ink discharge can be obtained stably under the state where the stamping surface is not easily affected by the degree of the forming press force, ink leakage can be reduced to minimum and a flat stamping surface with minimum wrinkles is provided. Further, this stamping device can reduce variance of the ink density and missing of stamping to provide a desired printed matter.
