Abstract (en)
[origin: EP0890703A2] The end component (19) is connected with the lamellas (18) by elongated, flexible support components. Two long guide components (25) are available, each of which is movable by a slide connected with one end of the end component. Each guide (25) has two wheels, of which one is rotatable in the positioning device. For each guide, a transmission component connected with the slide is wound around the two wheels. The transmission component has two ends connected together or is endless and is movable by the wheel connected with the positioning device. The wheels are formed as gearwheels (37,38) and the transmission component is a toothed belt (47) or chain, being in engagement with the gearwheels.
