Abstract (en)
[origin: EP0890968A2] The safety switch has a switching mechanism (2) which can be activated at least by an overload trigger element (2). At least one, pref. Two, further switches can be coupled to the first switch so that an overload on one switch causes isolation by all switches. A current range setting device contains an actuation element and an associated current scale. A wedge-shaped adjustment element (4) between the overload trigger element and a yoke (3) acting on the switching mechanism is permanently attached to an intermediate guide part (6) via an elastically flexible spring (13). The guide part is mounted in the switch housing so as to be movable in the working direction of the overload protection element.
