Abstract (en)
[origin: DE19703076C1] In order to put a good value, easy to use, home brew device for laymen on the market, the appliance-carrying base/lid system was developed. The invention is characterized in that a brewing lid (2) is connected via joiner elements (4) to the base (1), and an ordinary pot (5) is placed in between. During filtering and/or fermenting, the brewing lid is replaced by the filtering and the fermenting lid (3). The lids have the necessary appliance elements for the respective partial brewing process, so that the pot, located between the lids and the base, serves exclusively as a receptacle. Upon use of longer joiner elements, filter basket and filter axis, as well as of a larger, flexible filter, different pot volumes can be used with the same pot diameter. The home-brew device is suitable, due to its simple structure and simple built-in appliance elements, for qualified beer brewing by the layman.
