Abstract (en)

[origin: EP0891864A1] The mechanical appliance (1,2) treats or processes continuous webs of material (6) and incorporates a device (8) for winding and unwinding the web. At the start of the deceleration of a sheet, a switch (19) releases a mechanism for activating an auxiliary stack. Before the machine treating the continuous web is set in motion, the combined reeling and unreeling appliance is set to wind up the web. The combined reeling and unreeling appliance is set to unwind at the beginning of operation of the machine.
