Abstract (en)

[origin: WO9736147A1] Methods and apparatus for accurately surveying and determining the physical location of objects in a scene are disclosed which use image data captured by one or more cameras and three points from the same scene which may be either measured after the images are captured or may be included in the calibrated target placed in the scene at the time of image capture (800). Objects are located with respect to a three-dimensional coordinate system defined with reference to the three points (820). The methods and apparatus permit rapid set up and capture of precise location data using simple apparatus and simple image processing. The precise location and orientation of the camera utilized to capture each scene is determined from image data (860), from the three point locations and from the optical parameters of the camera.
