Abstract (en)

[origin: EP0893365A1] The two separate components (A,B) are contained in separate superposed containers (2,3) which can be rotated relative to each other in order to communicate. The two containers are sealed by a sealing lip (9) which is applied tightly on the internal radial surface of the upper part (10) of the neck (4). An obturator (12) comprising a plug (13) connected by a link (14) forming a hinge to a ring (15) seals the channel (7).
