Abstract (en)
[origin: WO9737850A1] The invention concerns an inking-pad printing press which comprises at least one container (1) for inking a printing plate and a press device for pressing the container against the printing plate. The printing plate (2) and the container are moved in a mutually reciprocating manner by means of a drive in order to ink a printing block of the printing plate (2). During the inking process, the position of the container relative to the longitudinal axis of the printing block and hence to the printed image is varied by a further relative movement. This further relative movement is, for example, an oscillating, rolling, swaying, swinging or thrusting movement.
