Abstract (en)

[origin: DE19615674A1] The invention relates to a device for inserting at least one semiconductor component into a receptacle, in particular into a base for testing the electrical performance of a semiconductor component. Said device is provided with at least one receiving chamber (46) for the semiconductor component (12), the receiving chamber (46) having a receiving opening (56). The device also has at least one member (34) for moving the semiconductor component (12) in a direction of movement (58) through the receiving opening (56) into the receiving chamber (46). The movement member (34) has a gas cushion generating device (62) which produces a gas cushion (60) moving the semiconductor component (12) at least into the receiving opening (56).
