Abstract (en)

[origin: WO9832152A1] A method of manufacturing a cathode ray tube having an antistatic, anti-reflective filter, in which method a first conductive layer (for example a layer on the basis of indium-tin oxide) is provided by means of sputtering. A second layer containing SiO₂ is applied to the first conductive layer by means of a wet-chemical process, for example spinning and, subsequently, drying of a TEOS-compound. The method enables an antistatic, anti-reflective filter to be manufactured in a sample manner which can suitably be used on an industrial scale, which filter exhibits good antistatic and anti-reflective properties as well as a good shielding effect.
