Abstract (en)

[origin: EP0895198A2] The road vehicle has a memory that is used to store diagnostic data that is combined with a remotely accessed and interlocked system. Built into the unit is a transmitter that is used to relay data to a central data processing system. Access is obtained by the central station making a request by transmitting a remote specific vehicle identification code. The system may be accessed when the vehicle system is in the sleep mode.
