Abstract (en)  
[origin: EP0896196A1] The transfer device (18) is positioned between a first (16) and second enclosure (19) for the treatment of steel products initially arranged on some fixed stringers (23). It has a chassis fitted with an assembly made up by the juxtapositioning of several moving stringers (24) and possibly several rollers (30), these being positioned between the enclosures and at the end of a transfer line (20) for the steel products (2). The moving stringers (24) cooperate simultaneously with a lifting/lowering chassis (25) and with a translation chassis (26). These chassis allow the stringers to describe a rectangular pass consisting of four elements:- a) a lifting movement; b) a forward translation; c) a lowering movement; and d) a backward translation. An installation for the metallurgical treatment of steel products incorporating this device is also claimed.
