Abstract (en)

[origin: EP0896940A1] The paper web (11,12) winding machine also has a cutter (1) which divides the web when the roll is complete. The machine has a rotary unit (17,18) enabling the completed roll to be rotated about an axis (14) to the vertical position. Rotation of the roll to a vertical axis for winding removes the weight of outer layers of paper from the inner layers of paper and cardboard tube core. This reduces the overall hardness of the roll.
