Abstract (en)

[origin: DE19736326C1] A suction pipe is located in the upper area of the storage container. It comprises a venting conduit (5), the open end of which issues into a suction funnel (6) of a suction hood (7). The suction installation is formed as an air quantity amplifier. The surface ratio of the suction funnel at the level of the end of the venting conduit, less the cross-section surface of the venting conduit, to the cross-section surface of the venting conduit (5) at its end is in the range of 1.5-3. The air quantity amplifier is a so-called air mover, which works in accordance with the Coanda effect. As drive compressed air is used, fed into a ring chamber via a feed conduit (9).
