Abstract (en)

[origin: EP0898142A2] The operating device is formed as an axially movable pistol grip (2) with a statistically located trigger cock (5) framed by a trigger stirrup (6). It is connected with the closure (1) by two L-shaped strips (3) which slide on both sides of the axis of the barrel in grooves and with their shorter ends are anchored to the closure. The L-shaped strips (3) with their longer ends are anchored to the pistol grip and the trigger stirrup. The securing device incorporates a spring-loaded trigger (7) fitted on the rear-side extension of the pistol grip, via which the repeater unit is locked in the closed position of the closure and in the operated state of the trigger the trigger cock (5) is released.
