Abstract (en)
[origin: WO9840778A1] Wire spectacle frame comprising a bent wire central bridge portion forming two side loops into which elastomer pads are securely inserted and having lens fastening means at the two ends, bent wire side bars with a spiral wound wire coil hinge between the side bar and a lens holding arm having lens fastening means, composed of a first coiled wire termination of the wire side bar defining a circular hole of a certain diameter; a second coiled wire termination of a wire lens fastening frame portion defining a circular hole of the same diameter of said first coiled wire termination of the side bar; and a countersunk headed hinge pin passing through said circular holes and connecting together said two coiled wire terminations. The head-to-head abutting together of the two ends of said two spiral wound coiled wire terminations defines a rotational stop of the hinge with the side bar open.
