Abstract (en)

[origin: EP0898908A2] The device extracts fibre bunches from up to three fibre boxes (14,16,18). It has a bundle pick-up (10), a counter part (12), and a slide (20) moving between counter part and boxes. The slide has three channels (22,24,26) associated with the three boxes. The outer channels are angled towards the central channel. A pressure plunger (28,30) is positioned between the central box and the box on either side. The end face of each plunger facing the slide is supported on a side face of the slide, or pressure-charges the opposite end of one of the outer channels dependant upon the position of the slide.
