Abstract (en)
A cylinder lock including a rotor (7) rotating in a cylinder case (8) and a plurality of interference members (13) adapted to prevent the rotor (7) from rotating. Each interference member comprises a key activated first element (14) adapted to allow a second element (18) to move from a locking position of the rotor (7), to a free position of rotation of the rotor (7) in the cylinder case (8). The first element (14) is operatively connected to the second element (18) by a spring (19). <IMAGE>
