Abstract (en)

[origin: EP0899753A1] A bulky magnetic core is disclosed which is composed of a magnetic core body derived by sintering a powdered stock of a soft magnetic glassy alloy, or by cooling a hot melt of the glassy alloy in solidified form, the glassy alloy containing one or more elements selected from Fe, Co and Ni as main components, one or more elements selected from Zr, Nb, Ta, Hf, Mo, Ti and V, and also B, the glassy alloy having a temperature interval ΔT_x of higher than 20 DEG C in its supercooled liquid region, the ΔT_x being represented by the equation $\Delta T_x = T_x - T_g$ where T_x is a crystallization temperature, and T_g is a glass transition temperature. A laminated magnetic core is also disclosed in which a magnetic core body is derived by helically winding or laminating a ribbon of the above soft magnetic glassy alloy. <IMAGE>
