Abstract (en)
[origin: WO9744545A1] A metering screw (20) meters dry granular perlite material from above into a pressure container (10) which can be connected to a compressor (30). At the same time, the perlite material is mixed with an inorganic aqueous binder from a supply vessel (22). The resultant adhesive dry compound is pressurized in the pressure container (10) and fed via a feed line (32) to a cavity in a building. A flexible lance at the end of the feed line (32) injects the insulating compound into the cavity and simultaneously compresses it. After hardening, a cohesive, dimensionally stable insulating body with a high heat-insulating factor is produced.
