Abstract (en)

[origin: EP0901246A2] The reception method, for digitally-coded messages provided by at least one transmitter, uses a local table stored in a memory (17) at the receiver for decoding the messages, with verification that the required part of the local table for decoding the message is present, to allow a request to be transmitted to the service provider for transmission of the required part of the local table, with updating of the table stored at the receiver.
