Abstract (en)
[origin: EP0901279A2] An improved high-performance vertical sync separator (10) which can reliably operate during high frequency and non-standard video signal conditions and that utilizes a device-independent methodology. The synth separator (10) includes a signal separator circuit (18) having an input port (30) for receiving a composite signal (16). A measuring device (36) connected to the input port (30) measures a first and second characteristic of the composite signal. A processor (40) receives and compares the first and second characteristics, and recovers a vertical sync signal (20) from the composite signal (16). <IMAGE> <IMAGE>
