Abstract (en)

[origin: WO9745617A1] A cable transmission connected to a drive unit comprises a pair of flexible sheaths (32, 34) each having a first end anchored to a housing of the drive unit and a second end anchored to a slide (22) which supports a pane and is slidable along a track (20). A flexible cable which extends around a drum of the drive unit comprises two branches (46, 48) slidable in the respective sheaths (32, 34). The slide (22) has a pair of internal ducts (50, 52) for guiding the branches (46, 48) of the cable, the ducts extending between inlet openings, to which the second ends of the sheaths (32, 34) are anchored, and respective opposed outlets facing towards respective opposite ends of the track (20). The two opposite ends of the cable are anchored to the respective ends of the track (20) so that respective portions (46a, 48a) of the cable disposed between the respective outlets and the respective ends of the track (20) extend parallel to the track.
