Abstract (en)
[origin: WO9739387A1] The invention describes a process for simplifying production of a wrist watch consisting of a watch-movement, a case, in which the watch-movement is arranged on a watch frame, a supporting structure for fastening a wristlet, as well as a case back-cover. The supporting structure is a solid element with an annular section and an external side surface on which are located two receptacles for fastening a wristlet, as well as an inner surface. The case contains a watch-movement support (7) and a glass (8), which is affixed to the watch-movement support by a gasket (9), the glass affixing the watch-movement to the watch-movement support. The watch-movement support has an outer area which interlocks with the inner surface of the supporting structure. The case back-cover is detachably affixed to the watch movement support.
