Abstract (en)
[origin: EP0902133A2] The lighting device has a base (4) and a lighting body (2) including at least one light source (9). The body can turn about a first rotation axis (19). It can also turn on a bearing arm (3) about a second rotation axis (25). The two rotation axes are aligned in different directions. The lighting body may be able to turn about a rotation axis which runs through the base, or the bearing arm with the lighting body on it may be able to turn about such an axis. The two rotation axes may be orthogonal to each other.
