Abstract (en)

[origin: EP0903086A2] The present invention relates to a motorcyclist helmet, comprising channels for the passage therethrough of an air flow generated as the motorcycle is driven, said channels being defined by connecting a contoured inner construction to the outer cap of the helmet. To the contoured construction soft foamed material bands contacting the user head are applied. Each ventilating channel is provided with an air flow inlet, arranged on the front and at a lower position than the helmet visor, as well as with air flow outlets arranged at portions of the helmet which are not covered by the foamed material bands. The subject helmet is moreover provided with a transparent material covering element. <IMAGE>
