Abstract (en)

[origin: US6016757A] A tufting device for the filling tool of a brush tufting machine is provided which permits the operating stroke of the filling tool to be varied and adjusted without affecting operating speed and precision of operation. The tufting device has a guide block, a guide channel in the guide block, a tuft driver tongue driven with a reciprocating movement and movably received in the guide channel, and a header having a through channel aligned with the guide channel. The header and guide block are driven with a relative reciprocating movement towards and away from each other. The device further has a drive system with a rotating drive shaft, a cam on the drive shaft and a cam follower riding on the cam. The cam follower is driven by the cam with a reciprocating movement of a predetermined stroke length. The drive system further comprises a conversion mechanism for converting the reciprocating movement of a predetermined stroke length into a drive stroke of an adjustably variable length. The relative reciprocating movement of the header and guide block and the reciprocating movement of the tuft driver tongue are both derived from the drive stroke imparting a stroke of variable length to both reciprocating movements. The tuft driver tongue and the header and guide block consistently assume a predetermined initial position irrespective of the stroke length of the reciprocating movements for taking over a tuft of fiber.
