Abstract (en)

[origin: WO9744557A1] An electronic apparatus for the electromagnetic release of a lock including in combination a portable device (7) provided with power supply and a stationary, not powered device formed of a receiver (9) which controls locking/unlocking members (5, 6) installed within the room or cabinet to be opened or closed, said portable device (7) being capable of supplying said receiver (9) located within the room or cabinet with energy by electromagnetic interaction so as to operate the locking/unlocking members (5, 6) which open or close the door (11) of the room or cabinet. There are also provided an integrated coder which selects a coded key for ciphering a recognizing signal for controlling the opening of the door and a non-volatile memory for storing the recognizing code, the number indicating how many times the door has been opened as well as further desired data.
