Abstract (en)

[origin: DE19740395A1] The arrangement includes a sloped guide plate (2), a transportation arrangement (1) orthogonal to the guide plate, as well as an auxiliary device which comprises a rising guide slope and permits a defined slip of the surface of the print carrier vertically to the transportation surface. An ink-jet print head (4) controlled through a control device (40) is arranged stationary in an extrusion of the guide plate during the printing. The arrangement includes a sloped guide plate, a transportation arrangement orthogonal to the guide plate, as well as an auxiliary device. An ink-jet print head controlled through a control device is arranged stationary in an extrusion of the guide plate during the printing. The extrusion (21) is formed in such way, that the print carrier (3) lies exposed downstream with the imprinted area. The print carrier transported by the transportation arrangement borders freely at an auxiliary device which comprises a rising guide slope and permits a defined slip of the surface of the print carrier directed vertically to the transportation surface.
